

Amphasys Pollen Analysis Instructions

June 2026

The following recommendations for measurement of pollen or microspores are best practice suggestions. They are most likely to produce good results for viability, development stages and ploidy measurements. It is recommended to use fresh samples, if possible and to filter the samples before use and measure immediately. Dried pollen samples should be rehydrated before measurement. Pollen and microspores are complex particles influenced by many factors that can have an effect on the outcome of the measurements (stability at the flowers/anthers, in AF buffer, pollen/flower storage etc.). Please refer to our QuickGuides for more details.

Overview General information

Measurement templates:	Templates please contact Amphasys support team.
Pollen size:	Pollen size can vary about 20% or even more! Polyploidy influences pollen size. Please contact Amphasys support for special applications.
AmphaFluid (AF) buffer recommendations:	Pollen viability: column "AF buffer pollen" Further purposes: also try "alternative AF buffers"
Sample preparation:	Please refer to the Quickguides
Dried, stored pollen:	Rehydration of pollen, equilibration in buffer
Sticky or oily pollen:	Add 0.05% Tween 20 or 80
Microspores, protoplasts	microspores or protoplasts of most species work with AF6 or a dilution of the microspore/protoplast isolation medium with AF6 1:4 to 1:6
Contact:	For any questions, assistance and templates: support@amphasys.com
Chip sizes:	80 µm; 120 µm; 250 µm; 300 µm
